

A world map illustrating the geographic distribution of two types of genetic variation. The map uses a circular projection and shows landmasses in light gray. Blue dots represent 'Within-population coexistence', while orange triangles represent 'Geographic differentiation'. The distribution is as follows:

- Within-population coexistence (Blue dots):** These are widely distributed across all major landmasses, including North America, South America, Europe, Africa, Asia, and Australia. They are particularly dense in North America, Europe, and Asia.
- Geographic differentiation (Orange triangles):** These are more localized and appear in clusters. Notable concentrations are found in North America (primarily in the western and central regions), Europe (primarily in the western and central regions), and parts of Asia (primarily in the eastern and southern regions). There are also some orange triangles in South America and Australia.
