

A world map illustrating the distribution of two types of genetic differentiation: within-population coexistence (represented by blue dots) and geographic differentiation (represented by orange triangles). The map shows a high density of both markers in North America, Europe, and East Asia. Within-population coexistence is also prevalent in South America, Africa, and Australia. Geographic differentiation is notably concentrated in North America and Europe. The map is enclosed in a black oval frame, and a legend in the bottom-left corner identifies the symbols.
