

Within-species distance-colour association

369 equally weighted species | 21,424 photos | 999 within-species permutations

Small positive exploratory association; independent replication and flower-specific controls remain pending.

All species are shown, not only significant ones. Pairwise distances are not independent replicates.

Gray band: central 95% of the null distribution, NOT a confidence interval on the observed effect.

A distance association does not establish a shared geographic boundary, environmental driver or pollinator mechanism.
